Parts of Our Body

Try It Out

- We see with our _____.
- We smell with our _____.
- We hear with our _____.
- We feel with our _____.
- We taste with our _____.

My _____ is here.

My _____ is here.

My _____ is here.

Stand in front of a mirror and look at your body. Our body is amazing. It is made up of many parts that are working all the time to keep us alive.

A part of our body is called an **organ**.

Let us take a look at different parts our body and what they do :-

External Organs

The parts of our body that we can see and touch with our hands are called **external organs**.

Our arms and legs are our external organs.

Other external organs are head, neck, eyes, ears, nose etc.

Eyes, ears, nose, tongue and skin are our sense organs. They give us the ability to see, hear, smell, taste and feel.

Head

The head is the part of the body above the neck. It has the sense organs-eyes, ears, nose and tongue. It also has the most important part of our body, that is, **brain**. Brain controls the working of other parts of our body.

Neck

Our neck joins the head to the rest of the body. It helps our head to move in upward, downward, left and right direction.

Internal Organs

The parts of our body that cannot be seen from outside are called our internal organs. **Brain, heart, lungs, stomach, kidney** etc. are some of our internal organs.

Brain

The brain is the most important part of our body.

It controls every other part.

The brain decides and instructs our body to react accordingly.

I control all the parts.

I pump blood to all the parts.

Heart

The heart is located inside our chest. It is small pear-shaped organ placed between the lungs. It beats all the time and helps to transfer blood to and from different parts of our body.

Stomach

The stomach is a J-shaped bag inside our body. We chew the food in the mouth. It then passes through our food pipe and reaches our stomach. The stomach helps to digest the food and extract all the nutrients from it.

I keep your food and digest it.

I help you to breathe.

Lungs

There are two lungs in our body. They help us to breathe. When we breathe in, we take in the air and use oxygen from it. When breathe out, we give out carbon dioxide.

**Do
You
Know?**

When you sneeze, all your bodily functions stop ; even your heart.

Think About It

Which is the largest organ in our body.
